

## Lap Bench

Very useful for power carving.

The lap bench is extremely easy to make and to use.

*Lap bench with a DustSucker&More!™ screwed in place. The DustSucker&More!™ tames the mess generated when carving or sanding.*

Just cut the lap bench to size, round corners, cut the relief in front for your body, and add a handle hole if desired. Plans for the handle hole jig and corner rounding jig are available on my web site.

After cutting board to shape apply three coats of poly. Lightly sand between coats.

Sit down and place the bench on your lap. Place a DustSucker&More!™ where it is most convenient for you

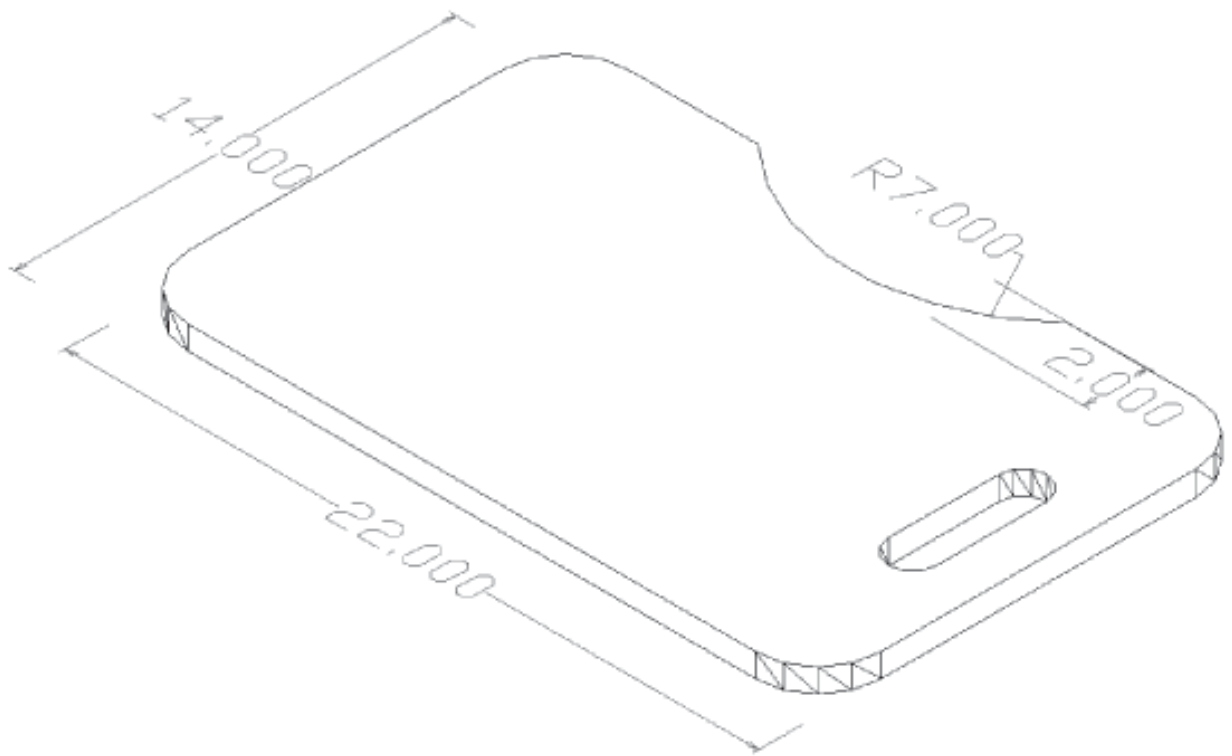

*Handle jig clamped in place.*

and mark a front and side line with a pencil. Now screw the DustSucker&More!™ in place aligned with the marked line with four screws. This is the only application where you are required to screw the DustSucker&More!™ down. The length of the screws depends on the thickness of the material used..

I made this bench from a piece of 1/2" thick birch plywood scrap. MDF is another excellent choice of material.

*Handle cut in lap bench with pattern bit and router. Location not critical.*
